Plasminogen, the proenzyme of the fibrinolytically active enzyme plasmin, is a single chain glycoprotein with a molecular weight of about 90,000-94,000 Da (2). Various isoelectric forms exist and can be separated by means of isoelectric focusing (IEF). The complete amino acid sequence contains 790 amino acids. Native plasminogen (glu-plasminogen) has a N-terminal glutamic acid group. Partial plasma proteolysis gives rise to a molecule with N-terminal lysine (lysplasminogen).

Currently, the product has obtained the designation of orphan drug by the US Food and Drug Administration (FDA) and by the European Medicines Agency (EMA). Clinical trials are still underway to obtain Marketing Authorization in the United States and in Europe (EU). The report mainly targeting the research status, predicted competitive landscape, market potential and future trends of plasminogen market.

Plasminogen was originally used as an orphan drug for the treatment of congenital plasminogen deficiency, but the researchers found that he had positive effects on wound care and Diabetic Foot Ulcer treatment. And there is hope that the amputation costs and pain of such patients will be greatly reduced. Once FDA certification is available in the Diabetic Foot Ulcer area, it will benefit significantly from the 10 billion USD amputation market.
