Abstracts

Peat is a dark fibrous material created when 'decomposition fails to keep pace with the production of organic matter'. Although peat is created under specific conditions (waterlogging, lack of oxygen or nutrients, high acidity or low temperatures), peat can be found in many types of wetlands. Marshes, swamps, floodplains and coastal wetlands may contain peat.

According to QYResearch's new survey, global Potting Soil Peat market is projected to reach US\$ 4968.5 million in 2029, increasing from US\$ 4063.6 million in 2022, with the CAGR of 2.9% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Potting Soil Peat market research.

The potting soil market is primarily driven by the increasing interest in gardening and indoor plant cultivation, which has gained significant popularity among urban populations. As people embrace plant-related hobbies for their aesthetic and therapeutic benefits, the demand for high-quality potting soil rises. Additionally, the growing awareness of sustainable and organic gardening practices further propels the market, as consumers seek environmentally friendly and chemical-free soil options. However, the market also faces challenges. One such challenge is the competition from alternative planting mediums and hydroponic systems that offer space-efficient and water-saving solutions. Moreover, the fluctuating costs of raw materials used in potting soil production can impact product pricing and availability, posing a challenge to both manufacturers and consumers. To thrive in this market, stakeholders must navigate these dynamics while catering to the evolving preferences of gardening enthusiasts.
