## Abstracts

Treatment of acute radiation syndrome is generally supportive care. This may include blood transfusions, antibiotics, colony-stimulating factors, or stem cell transplant. If radioactive material remains on the skin or in the stomach it should be removed.

According to QYResearch's new survey, global Radiation Toxicity Treatment market is projected to reach US\$ 5591.9 million in 2029, increasing from US\$ 3762 million in 2022, with the CAGR of 5.8% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Radiation Toxicity Treatment market research.

The radiation toxicity treatment market is driven by the increasing use of radiation therapy in cancer treatment and the growing number of nuclear accidents and incidents. Radiation therapy is a critical component in cancer treatment, but it can lead to radiation toxicity, causing various side effects in patients. As the number of cancer cases rises, the demand for radiation therapy is also increasing, consequently driving the need for effective radiation toxicity treatments. Additionally, nuclear accidents and incidents, such as nuclear power plant disasters and radiation exposure from accidents or terrorism, highlight the importance of developing treatments for radiation toxicity. However, the challenge lies in developing treatments that effectively mitigate the harmful effects of radiation while minimizing side effects. Additionally, regulatory approvals and safety concerns are significant challenges in bringing radiation toxicity treatments to the market. Collaborative research efforts and advancements in medical technology are vital in addressing these challenges and providing safer and more effective radiation toxicity treatments.
