Refinery Process Additives market. Refinery process additives (RPA) are the chemicals used to enhance the performance of fuel by meeting the fuel specifications setup by government authorities. These additives are added at the time of refinery process as well as can be used to recuperate the performance of particular end product specification such as diesel or gasoline. The Refinery Process Additives products are used in various refinery processes such as distillation process, reformer system, cracker, coker, filling plant process, catalytic reforming, desulfurization, vacuum distillation and so on. These products are only used by oil and gas industry.

Refinery process additives can be classified based on application process. Primary process refers to crude oil processing, which are mainly atmospheric distillation and vacuum distillation. Distillation processes can be classified as fluid catalytic cracking(FCC), Hydroprocessing etc. in terms reaction type. Crude Oil Processing is the largest application of refinery process additives, with market share of 60.01% in 2016.

Main types of refinery process additives used in the sector are scale inhibitors, antifoams, corrosion inhibitors. In FCC process, additives are mainly for product distribution improvement and product quality improvement.
