Remote Terminal Unit (RTU) is a device installed at a remote location that collects data, codes the data into a format that is transmittable and transmits the data back to a central station, or master. An RTU also collects information from the master device and implements processes that are directed by the master. RTUs are equipped with input channels for sensing or metering, output channels for control, indication or alarms and a communications port.

In a smart grid, the remote terminal unit can collect the data of the electric power condition and transmits the data to the station. Today, RTU is a necessary part in the smart grid and transformer substations.

In the production market, North America is the largest supplier of remote terminal unit at a market share more than 30%. While it is also the largest consumption market, followed by Europe and China.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
