Abstracts

RNA interference (RNAi) is a biological process in which RNA molecules inhibit gene expression, typically by causing the destruction of specific mRNA molecules. Historically, it was known by other names, including co-suppression, post-transcriptional gene silencing (PTGS), and quelling. Only after these apparently unrelated processes were fully understood did it become clear that they all described the RNAi phenomenon. RNAi is now known as precise, efficient, stable and better than antisense technology for gene suppression.

RNAi for Therapeutic is in the development stage and there is no use in the market. The fastest research is Clinical phrase III, Such as QP1-1007, QO1-1002 of Quark Pharmaceuticals. The major technology of RNAi for Therapeutic is siRNA, miRNA and shRNA. SiRNA technology is the most popular, with the expenses market share of 85%, following SiRNA, miRNA is the second of 16% expenses market share in 2015. Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
