Abstracts

Freezing media which contain sera have the disadvantage of a fluctuating and not defined composition. Reproducibility of experiments with cells which were stored in a serum containing medium, could be affected by the usage of a different charge of the corresponding medium, since the composition of serum varies from batch to batch and only a limited amount of each batch is available.

According to QYResearch's new survey, global Serum-Free Freezing Media for Research market is projected to reach US\$ 250.1 million in 2029, increasing from US\$ 132.8 million in 2022, with the CAGR of 9.6% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Serum-Free Freezing Media for Research market research.

The cryopreservation media market is driven by the growing demand for advanced techniques to preserve and store biological samples, cells, and tissues at ultra-low temperatures. Cryopreservation media, containing cryoprotective agents, are crucial for maintaining cell viability and functionality during freezing and thawing processes. Advancements in stem cell research, regenerative medicine, and biobanking have further fueled market growth. Additionally, the rising prevalence of chronic diseases and the increasing use of cell-based therapies have led to a growing need for long-term storage of valuable biological materials. However, challenges include the complex formulation of cryopreservation media, strict quality control requirements, and the need for continuous research to optimize cryopreservation techniques and ensure maximum cell recovery post-thaw. Overcoming these challenges through research collaborations, product innovation, and standardization will be vital for the sustained growth of the

cryopreservation media market.
