Abstracts

Single Nucleotide Polymorphism (SNP) Genotyping is the measurement of genetic variations of single nucleotide polymorphisms (SNPs) between members of a species. It is a form of genotyping, which is the measurement of more general genetic variation. SNP genotyping is not only the genetic markers present in most, but also the most promising markers. SNP genotyping as the most potential for development of molecular markers, it can achieve large-scale highly automated, thus it is more suited to a huge number of detection and analysis, has been widely used in biology, agriculture, medicine, biological evolution and other fields.

SNP genotyping is the simplest form of DNA variation among individuals. These simple changes can be of transition or transversion type and they occur throughout the genome at a frequency of about one in 1,000 bp. In the whole SNP genotyping industry, only a few companies can provide SNP genotyping platform while SNP genotyping service provider are located widely in the world.

SNP genotyping has various genotyping methods, such as TaqMan probe method, SNaPshot method, .MassArray method, .Illumina BeadXpress, HRM method and so on. Each method has its own characteristics. SNP genotyping will adopt an appropriate method according their customers' specific demand or wanted results.

Illumina, Affymetrix and Applied Biosystems are industry leaders. They can provide SNP genotyping platform, reagent and service to their clients. Besides, all of them have authorized companies around the world to use their platform to offer genotyping service to some countries. In fact, in the platform field, the industry is still highly monopolized for the time being.

We tend to believe that this industry still has a bright future, considering the current gene research. There is also no doubt that there are will be more and more companies to provide innovative SNP genotyping related products and service to customers in the

next few years, promoting the industry to develop healthily.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
