## Abstracts

Solar Thermal Collector collects heat by absorbing sunlight. A collector is a device for capturing solar radiation. Solar radiation is energy in the form of electromagnetic radiation from the infrared (long) to the ultraviolet (short) wavelengths. The quantity of solar energy striking the Earth's surface (solar constant) averages about 1,000 watts per square meter under clear skies, depending upon weather conditions, location and orientation.

Although Chinese overall economic downward trend in the past few years, and international economic situation is complicated, the enormous potential of the solar thermal industry still make many manufacturers can't wait to enter into the market. In the future, solar thermal industry may be in a development peak period.

There is a certain market space in demand of solar thermal collectors, efficient solar thermal collectors will determine whether an enterprise can achieve a success, small and medium size enterprises need to increase investment in research and development to innovate new products

Despite the presence of competition problems, due to the global recovery trend is clear, investors are still optimistic about this area; the future will still have more new investment enter the field.

As large demand of high-efficient products at home and abroad, many companies began to enter the field of high-end. Currently, the Chinese solar thermal collector industry is not only begin to transit to high-efficient solar thermal collector products, while still extend in downstream industry chain.

Although sales of solar thermal collector brought a lot of opportunities, the study group recommends the new entrants just having money but without technical advantage and downstream support do not to enter into the solar thermal collector field.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a
