## Abstracts

The steam water heater system consists of two major components: a heat exchanger and a blending valve. The interaction of these two components provides instantaneous and continuous hot water, given a steady supply of steam and inlet water.

The heat exchanger has inputs of steam and cold water that enter and stay separate via a coil or pipe system. The thermal difference of the two increases the temperature of the water, which is output to the blending valve. The thermal decline of the steam causes it to condense into water, which is then drained out.

USA is the largest production regions, occupied 83.81% market share, and the production was 2475 units in 2015. Patterson Kelly, AERCO, PVI Industries, Graham and Leslie Controls are the major producer, and the leading companies' occupied 56.15% market share.
