Abstracts

Telepsychiatry is a branch of telemedicine defined by the electronic delivery of psychiatric services to patients. This typically includes providing psychiatric assessments, therapeutic services, and medication management via telecommunication technology, most commonly videoconferencing.

By leveraging the power of technology, telepsychiatry makes behavioral healthcare more accessible to patients, rather than patients having to overcome barriers, like time and cost of travel, to access the care they need. Forensic telepsychiatry is the use of a remote psychiatrist or nurse practitioner for psychiatry in a prison or correctional facility, including psychiatric assessment, medication consultation, suicide watch, pre-parole evaluations and more. Telepsychiatry can deliver significant cost savings to correctional facilities by eliminating the need for prisoners to be escorted to off-site appointments and psychiatric interventions.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
