Thoracic catheter is a flexible plastic tube that is inserted through the chest wall and into the pleural space or mediastinum. It is used to remove air (pneumothorax) or fluid (pleural effusion, blood, chyle), or pus (empyema) from the intrathoracic space. It is also known as a Bülau drain or an intercostal catheter.

The thoracic catheter is connected to a closed chest drainage system, which allows for air or fluid to be drained, and prevents air or fluid from entering the pleural space. The system is airtight to prevent the inflow of atmospheric pressure. Because the pleural cavity normally has negative pressure, which allows for lung expansion, any tube connected to it must be sealed so that air or liquid cannot enter the space where the tube is inserted.

The global average price of Thoracic Catheters is in a decreasing trend from 20.28 USD/Unit in 2012 to 20.13 USD/Unit in 2016. With the situation of global economy, prices will be in slowly decreasing trend in the following five years.

The classification of Thoracic Catheters includes Catheter, Analog and Digital. The proportion of Catheters in 2016 is about 94.52%, and the proportion is in Decrease trend from 2012 to 2016.
