Abstracts

This report studies the global Transmission Electron Microscope (TEM) market status and forecast, categorizes the global Transmission Electron Microscope (TEM) market size (value & volume) by manufacturers, type, application, and region. This report focuses on the top manufacturers in North America, Europe, Japan, China, India, Southeast Asia and other regions (Central & South America, and Middle East & Africa). Transmission electron microscopy (TEM) is an imaging technology in which electron beams pass through very thinly sectioned specimens. As the electrons are transmitted through the specimen and interact with its structure, an image resolves that is magnified and focused onto an imaging medium, such as photographic film or a fluorescent screen, or captured by a special CCD camera. Because the electrons used in transmission electron microscopy have a very small wavelength, TEMs can image at much higher resolutions than conventional optical microscopes that depend on light beams. Due to their higher resolving power, TEMs play an important role in the fields of virology, cancer research, the study of materials, and in microelectronics research and development.

Geographically, United States was the largest market in the world, which took about 36.07 percent of the global consumption volume in 2014. Europe shared 30.05% of global total and China Shared 12.98%.

As to companies, FEI was largest company in 2014, which counted 35.47% share of global total output value. JEOL was the second, shared 30.74% of global total output value
