## Abstracts

Screws are used for internal fixation more often than any other type of implant. Although the screw is a simple device, there are different designs based on the type of fracture and how the screw will be used. Screws come in different sizes for use with bones of different sizes. Screws can be used alone to hold a fracture, as well as with plates, rods, or nails. After the bone heals, screws may be either left in place or removed.

According to QYResearch's new survey, global Trauma Fixation Screws market is projected to reach US\$ 1457.1 million in 2029, increasing from US\$ 990 million in 2022, with the CAGR of 5.6% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Trauma Fixation Screws market research.

The Trauma Fixation Device market is primarily driven by the increasing incidence of traumatic injuries and the need for effective orthopedic solutions. Trauma fixation devices, including implants, screws, and plates, offer vital support in stabilizing fractures and promoting proper bone healing. The rising awareness of sports-related injuries, road accidents, and falls contributes to market growth. Moreover, advancements in fixation technology, such as minimally invasive procedures and biocompatible materials, further propel adoption. However, challenges include addressing surgical complexities and potential complications like infection or implant failure. Navigating regulatory approvals, ensuring precise anatomical fit, and optimizing post-operative care are ongoing concerns. The market's success relies on continuous innovation in fixation device design, collaborations between medical device manufacturers and orthopedic surgeons, and comprehensive training for healthcare professionals while addressing the evolving challenges associated with trauma care and orthopedic solutions.
