Abstracts

Calcium citrate anhydrous is also named tricalcium citrate anhydrous. It is a tribasic salt of citric acid. It is manufactured from tricalcium citrate tetrahydrate. Water molecules of the tetrahydrate crystals are removed by a patented process without destroying the original crystal matrix. It occurs as colorless crystalline powder. It is insoluble in water and practically soluble in acid. Calcium citrate anhydrous is used as chelating agent, buffering agent, tissue coagulator, calcium fortifier and emulsifying salt. The absorption effect is more superior than inorganic calcium when it's used as food calcium enhancer. And it can be made chewable tablet, granule, capsule and oral liquid in pharmaceutical because it can be easier absorbed by the body than the calcium carbonate.

According to QYResearch's new survey, global Tricalcium Citrate Anhydrous market is projected to reach US\$ 57 million in 2029, increasing from US\$ 38 million in 2022, with the CAGR of 6.0% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Tricalcium Citrate Anhydrous market research.

Chemical is an important driver of this industry. Emerging economies, particularly in Asia and Latin America, are experiencing rapid industrialization, urbanization, and population growth. This drives the demand for bulk chemicals across various sectors, including construction, automotive, electronics, agriculture, and consumer goods. The rising middle class in these regions is also contributing to increased consumption of chemical products.
