Abstracts

Triethylantimony (CAS 617-85-6) is a colorless liquid with the molecular formula $C_6H_{15}Sb$. It is mainly used as a catalyst for organic synthesis. High-purity triethyl antimony provides antimony sources for AlSb, GaSb, InSb and other semiconductor materials. It is one of the most important sources for the growth of optoelectronic materials in metal organic chemical vapor deposition (MOCVD) and chemical beam epitaxy (CBE) processes.

According to QYResearch's new survey, global Triethylantimony (TESb) market is projected to reach US\$ 67 million in 2029, increasing from US\$ 42 million in 2022, with the CAGR of 6.8% during the period of 2023 to 2029. Influencing issues, such as economy environments, COVID-19 and Russia-Ukraine War, have led to great market fluctuations in the past few years and are considered comprehensively in the whole Triethylantimony (TESb) market research.

Triethylantimony (TESb) is a crucial organoantimony compound widely employed in the semiconductor industry, specifically in chemical vapor deposition (CVD) processes for the fabrication of III-V compound semiconductor materials. The rapid development of 5G technology and the Internet of Things (IoT) has fueled a sustained increase in semiconductor demand, subsequently driving the expansion of the TESb market. Currently, the TESb market is progressively growing with a relatively stable supply-demand equilibrium. However, with the rise of emerging technologies such as artificial intelligence, 5G communication, and wearable devices, the TESb market is anticipated to continue its growth trajectory.
