## Abstracts

Underground Mining Equipment is the mining equipment used in the underground.

Underground mining is a technique used to access ores and valuable minerals in the ground by digging into the ground to extract them.

Underground mining involves mineral production by extracting natural resources such as metals, coal, and minerals, including iron ore, titanium, bauxite, and copper, and various non-metallic products from beneath the earth's surface. The mining methods required for underground extraction are selected based on parameters such as geographical conditions, spatial and geometric characteristics, the economic value of ore, estimated operational costs, and availability of raw materials. Globally, APAC region generates the highest consumption value, followed by the North America, Europe, South America and Africa. The growing mining activities in developing countries of APAC such as China, India, and Australia, are the major factors influencing the growth of the market. Also, the growing demand from coal industry will drive the underground mining equipment market.

Since the COVID-19 virus outbreak in December 2019, the disease has spread to almost 100 countries around the globe with the World Health Organization declaring it a public health emergency.
