Abstracts

In urinary catheterization a latex, polyurethane, or silicone tube known as a urinary catheter is inserted into a patient's bladder via the urethra. Catheterization allows the patient's urine to drain freely from the bladder for collection. It may be used to inject liquids used for treatment or diagnosis of bladder conditions. A clinician, often a nurse, usually performs the procedure, but self-catheterization is also possible. The catheter may be a permanent one (indwelling catheter), or an intermittent catheter removed after each catheterization.

North America is the largest consumer of urinary catheters, with a consumption market share of 44% and a production market share of 37% in 2015.

China is the important supplier of urinary catheters. In 2015, the production revenue of urinary catheters was more than 19.7% share, and the consumption was about 6%. So there are large numbers of urinary catheters exporting from China.
