An adjuvant is a substance that is formulated as part of a vaccine to enhance its ability to induce protection against infection. Adjuvants are substances added to vaccines to enhance the immunogenicity of highly purified antigens that have insufficient immunostimulatory capabilities, and have been used in human vaccines for more than 90 years. And many vaccines also contain an adjuvant or adjuvant combination: these are substances added to vaccines specifically because of their immune enhancing effects. Adjuvants were initially used to counter the poor immunogenic potential of highly purified antigens. In recent years their role has expanded as our understanding of the immunology of vaccination has grown.

The classification of vaccine adjuvants includes veterinary vaccine adjuvants and human vaccine adjuvants. And the proportion of human vaccine adjuvants in 2016 is about 52.4%. The veterinary vaccine adjuvants in 2015 are about 47.6%.

The classification of Veterinary Vaccine Adjuvants includes Oral, Subcutaneous, Intramuscular and Others. And the proportion of Intramuscular in 2016 is about 56.3%. The Subcutaneous in 2016 is about 29%.

The classification of Human Vaccine Adjuvants includes Oral, Subcutaneous, Intramuscular and Others. And the proportion of Intramuscular in 2016 is about 55.5%. The Subcutaneous in 2016 is about 28.8%.
