Abstracts

A weather or sounding balloon is a balloon (specifically a type of high-altitude balloon) that carries instruments aloft to send back information on atmospheric pressure, temperature, humidity and wind speed by means of a small, expendable measuring device called a radiosonde. To obtain wind data, they can be tracked by radar, radio direction finding, or navigation systems (such as the satellite-based Global Positioning System, GPS). Balloons meant to stay at a constant altitude for long periods of time are known as transosondes. Weather balloons that do not carry an instrument pack are used to determine upper-level winds and the height of cloud layers. For such balloons, a theodolite or total station is used to track the balloon's azimuth and elevation, which are then converted to estimated wind speed and direction and/or cloud height, as applicable.

According to QYResearch's new survey, global Weather Balloon market is projected to reach US\$ 7 million in 2029, increasing from US\$ 6 million in 2022, with the CAGR of 2.1% during the period of 2023 to 2029.

The global weather balloon market is poised for steady growth due to the increasing demand for accurate weather data, advancements in instrumentation, and the need for comprehensive atmospheric studies. Technological innovation, collaborations among stakeholders, and the pursuit of sustainable solutions will play crucial roles in shaping the future of this market.
