Abstracts

POS Terminals is a computerized replacement for a cash register. The POS system can include the ability to record and track customer orders, process credit and debit cards, connect to other systems in a network, and manage inventory. Generally, a POS terminal has as its core a personal computer, which is provided with application-specific programs and I/O devices for the particular environment in which it will serve. A POS system for a restaurant, for example, is likely to have all menu items stored in a database that can be queried for information in a number of ways. POS terminals are used in most industries that have a point of sale such as a service desk, including Entertainment, Healthcare, Hospitality, and Retail.

Wireless POS Terminal enables merchants and service providers to accept payment cards wherever they do business. If you sell (or want to) at outdoor venues, sporting events, kiosks, food carts, open markets, customers' homes or any location where traditional connectivity is a problem, wireless has got you covered. Besides helping to increase sales by giving you access to new customers, wireless is flexible, reduces operating expenses and saves time.

The wireless POS terminal market is rapidly expanding in APAC. The growth of the market in APAC can also be attributed to the rapidly growing customer base owing to increasing prominence of small and medium businesses (SMBs) coupled with the reduction in total cost of ownership. Benefits associated with these systems such as low queue time, high degree of security, paper-free receipt option, decrease in check-out space requirement, and increase in floor space are the other factors that would help fuel the growth of the wireless POS terminals market in APAC.
