Abstracts

Ways of communication has undergone sea change in past two decades. With the advent of cheap electronic communication and technical devices we have more collaboration, social interaction, personalization, active participation and communication itself than ever before. One of the major reasons behind this is the emergence of internet as new channel; with advent of web 2.0 which allows dual communication which had not been possible in major way with any other channel; the interaction and communication has increased manifold.

Web 2.0 is affecting corporations too. They are seen both as an opportunity and threat by the corporations. Majority of businesses views broadband and online services as new revenue generators. At the same time it also threatens their current business models. Enterprises now increasingly incorporate web 2.0 'tools' part of their business or marketing routine. While seeing macro trend and cross checking with some micro trends we find that the collaboration productivity tools, unified communications, virtual worlds and Web services are among the tools likely to be adopted. Their adoption will, in turn, drive the growth of a social networking enterprise software industry.

As new, more user friendly and innovative Web 2.0 services emerges; many new industries will proliferate one of them will be online advertising. Among many reasons for this to happen; first, an increasing number of users worldwide are spending an increasing amount of time on the internet. Secondly, as new companies appear offering tools that make Web 2.0 even more attractive, this trend will accelerate. Advertisers will obviously want to reach this vast audience. And this change will not just involve private individuals: as corporate use of the internet increases, not only will advertising offer a way to reach such businesses, but it will also offer the corporate themselves a way to

reach potential customers both high-level clients and ordinary consumers.
