## Abstracts

### Description

Anticoagulant, including various products, is mainly used to prevent blood clotting. It will also be used when patients need to connect to some medical instruments or receive blood transfusions or when their blood needs to be sent for testing. Through the use of anticoagulant, diseases caused by blood clots like deep venous thrombosis, pulmonary embolism, myocardial infarction and stroke can be avoided.

With the ageing population and the increased incidence of cardiovascular diseases, current gold standard anticoagulants have become unable to satisfy the treatment demand. It is inevitable for improved drugs to come into the market. Warfarin and heparin which have monopolized the anticoagulant market for over half a century will gradually be replaced by the new generation of direct thrombin inhibitor and Xa factor inhibitor and finally fade out.

The representative varieties of thrombin are as follows: hirudin, recombinant hirudin, bivalirudin, argatroban and dabigatran etexilate. Direct thrombin inhibitor brought in a sales value of USD 2.4 billion in 2013, ranking third among anti-clotting drugs. And it occupied 10.4% of the total sales value of anti-clotting drugs while dabigatran etexilate accounted for 73.6% of the sum. According to CRI's survey, the sales value of thrombin in China rose from CNY 13 million in 2005 to CNY 20.77 million in 2014 with CAGR during this period reaching about 5.6%. Currently, major manufacturers of thrombin in the Chinese market are Changchun Guoao Pharmaceutical Co., Ltd, Biochemical Pharmaceutical Factory of Zhuhai S. E. Z., Hunan Yige Pharmaceutical Co., Ltd, Hacon Pharma and Wuxi Kaifu Pharmaceutical Co., Ltd.

With the change of life styles and ageing population, the incidence of cardiovascular disease is expected to keep increasing in the next few years in China, driving the market size of thrombin to expand further.
