Abstracts

Protein expression refers to the technique in which proteins are regulated, modified and synthesized in living organisms. Protein expression is an important part of proteomics allows the expression recombinant proteins in various host systems. Proteins are regulated and synthesized depending upon the functional need in the host cell. Generally, protein expression includes three process, namely, translation, transcription and post-translational modification. Moreover, there are three types of recombinant protein expression methods such as in-vitro protein expression, in-vivo protein expression and chemical protein synthesis. Huge opportunities in proteomics and increasing research activities in the pharmaceutical industry is driving the growth of protein expression market. Biotechnology based organizations mostly rely on protein expression for developing novel therapeutics with minimal side effects. At present, protein expression market is a profitable market venture due to increasing occurrence rate of various drug resistance diseases and high government support for biotechnology based drug development; which makes this industry a highly attractive market.
