Alpha-Amaylase Introduction

“Alpha-Amylase” is an enzyme, which is mainly consumed for the protein hydrolysis. Its mechanism involves the hydrolysis of alpha bonds in polymeric carbohydrate molecules i.e. polysaccharide to form maltose and glucose. Leads to breakdown of starch and carbohydrates in the body and hence functions as inhibitors for weight loss. Alpha-Amylase is obtained from different sources like plants, bacteria and fungi. In the field of pharmaceutical & food bacterial & fungal alpha amylase are dominatingly used in terms of market share & size. There are two methods generally used for manufacturing alpha amylase i.e. Solid state and submerged fermentation methods. Submerged fermentation method is the conventional method of alpha-amylase production and the different parameters such as temperature, moisture, pH level etc. can be controlled with ease in this method. Solid state fermentation is expected to account for significant share, due to its resemblance to natural habitat favorable for the growth of

microorganisms.
