REPORT DESCRIPTION

'Cyanuric Acid' or 1, 3, 5-triazine-2, 4, 6-triol is a chemical compound with the formula (CNOH)₃. Cyanuric Acid is an odorless white crystalline hygroscopic powder, slightly soluble in common organic solvents such as acetone, benzene, diethyl ether, ethanol, hexane. It is available for pharmaceutical & industrial grade application (bleaches, disinfectants, and herbicides). Cyanuric Acid exist in dry powder form, pellet form & also in liquid form depending upon the application. Cyanuric Acid current market size is 428 Million USD, with a CAGR of 25% for the session 2014-2017 & it is forecasted to grow with a CAGR of 32.1% during the session of 2018-2023.

Cyanuric acid, also known as stabilizer, used in outdoor pools to decrease the photodecomposition rate of available chlorine. When Cyanuric acid is added to pool water, a certain percentage of the cyanuric acid (H₃Cy) ionizes to form cyanurate (H₂Cy⁻). The portion that ionizes is pH-dependent. When cyanuric acid is added to pools using unstabilized chlorine, the ionized cyanurate combines with available chlorine to form stable chloroisocyanurates.

'Cyanuric Acid' is having a number of important non-pool uses, which include preparation of high performance magnetic-wire enamels, and in electrical varnishes, plastics with enhanced properties, flame-retardant resins and solid lubricants, cross-linking and curing agent in the manufacturing of plastics and coatings. Unlike other

'acids,' it is commonly referred to as a chlorine stabilizer or conditioner, forming a chemically weak and temporary bond with chlorine.
