Duloxetine Introduction

“Duloxetine” is a selective serotonin and norepinephrine reuptake inhibitor (SNRI) antidepressants generally used for treating depression, anxiety disorder, and pain. Duloxetine mainly affects neurotransmitters, the chemicals that nerves within the brain make and release in order to communicate with one another. Neurotransmitters either travel across the space between nerves or attach to receptors on the surface of nearby nerves or they attach to receptors on the surface of the nerves that produced them, to be taken up by the nerve and released again (a process referred to as re-uptake). Duloxetine targets major depressive disorders. It is manufactured & marketed by Eli Lilly & Company.
