EAR SYRINGE Introduction

“Ear Syringe” is a simple pump consisting of a plunger that fits tightly in a tube. The plunger can be pulled and pushed along inside a cylindrical tube (called a barrel), allowing the Ear Syringe to take in and expel a liquid or gas through an orifice at the open end of the tube. The ear syringing procedure typically takes between 15-30 minutes to perform. This can vary depending on the amount and type of ear wax. These ear syringing kits contain either a bulb-typed or flared-typed plastic ear syringe and are designed to squirt streams of water at different angles against the ear canal wall to avoid causing trauma to the eardrum. The idea behind ear syringing is for the water to get pumped ‘in behind’ the ear wax in order to flush it out of the ear.
