Leadless PACEMAKER INTRODUCTION

“Leadless Pacemaker” is a small implantable device that is used to maintain a suitable heart rate or to stimulate the lower chambers of the heart. It sends electrical pulses to the heart whenever it senses that the heartbeat is too slow. Leadless pacing devices are placed directly in the heart without the need for a surgical pocket and insulated wires (called leads). Pacemakers are generally used to treat patients with brady-arrhythmias, slow heart rhythms that may occur as a result of disease in the heart’s conduction system. It is a self-contained device which is inserted in the right ventricle of the heart.
