Nebulizer Introduction

“Nebulizer” is a device which is primarily used for the treatment of respiratory diseases such as asthma, COPD and cystic fibrosis by converting liquid medication into mist or aerosol for flexible delivery into the lungs. It uses ultrasonic power, compressed air & oxygen to convert solution & suspension into small aerosol droplets that can directly inhaled from device. It is the rechargeable device available in 3 type’s i.e. pneumatic, ultrasonic & mesh nebulizers. Prevalence of respiratory diseases coupled with a growing aged population fuels the growth of the global nebulizers market. The market is also driven by the use of portable nebulizers. Since nebulization is a spraying technique, dispersion and wastage of the drug during delivery to the respiratory tract is the major restraint for the growth of this market. It is also used for laboratory purpose during elemental analysis.
