#### Risperidone Introduction

“Risperidone” is white crystalline solid, which is soluble in methylene chloride, sparingly soluble in alcohol & practically insoluble in water. It is used as atypical antipsychotic in the treatment of mania and schizophrenia. Available in the form of injection, powder & tablet. Risperidone shows the ability of Risperidone to inhibit the D2 dopaminergic receptors and 5-HT<sub>2A</sub> serotonergic receptors in the brain. D2 dopaminergic receptors are transiently inhibited by Risperidone, reducing dopaminergic neurotransmission, therefore decreasing positive symptoms of schizophrenia, such as delusions and hallucinations. Risperidone binds transiently and with loose affinity to the dopaminergic D2 receptor, with ideal receptor occupancy of 60-70% for optimal effect. Rapid dissociation of Risperidone from the D2 receptors contributes to decreased risk of extrapyramidal symptoms (EPS), which occur with permanent and high occupancy blockade of D2 dopaminergic receptors. Low affinity binding and rapid dissociation from the D2 receptor distinguish Risperidone from the traditional antipsychotic drugs. A

higher occupancy rate of D2 receptors is said to increase the risk of extrapyramidal symptoms and is therefore to be avoided.
