Tracheostomy Tube introduction

A “Tracheostomy Tube” is a curved tube which is placed into a tracheostomy stoma (hole made in the neck and windpipe) to secure the airway for patients who need prolonged invasive mechanical ventilation, have upper-airway obstruction, underwent a laryngectomy, or have difficulty managing secretions. Tracheostomy tubes are used to administer positive-pressure ventilation, to provide a patent airway, and to provide access to the lower respiratory tract for airway clearance. The outer cannula is the outer tube that holds the tracheostomy open. A neck plate extends from the sides of the outer tube and has holes to attach cloth ties or Velcro strap around the neck. The inner cannula is placed inside the outer cannula and has a lock to prevent it from being coughed out. The obturator is used to insert a tracheostomy tube.
