ULTRASOUND DEVICE Introduction

“Ultrasound” is a medical imaging technique that uses high-frequency sound waves, to visualize internal organs of the body. It transmits high-frequency ultrasonic sound waves into the body of the patient. These sound waves are then reflected by the organs into the probe and are transmitted to a display that generates the image. The advances in 3D & 4D imaging which give a detailed evaluation of fetal anatomy and morphology are also found to be contributing to the overall market expansion. Color Doppler is a unique technique that assesses blood flow through a blood vessel, covering the body’s main

veins and arteries in the neck, arms, abdomen and legs or inside several body organs such as the kidneys and liver. 2D ultrasound device market share led revenue generation due to wide use in fetal screening and brain tumor. Large number of healthcare clinics and hospitals in developing nations offer this technology due to comparatively lower cost, which results in greater affordability for patients.
