According to Statistics MRC, the Global Ballistic Protection market is accounted for \$12.60 billion in 2020 and is expected to reach \$24.02 billion by 2028 growing at a CAGR of 8.4% during the forecast period. The need for lightweight, comfortable, and high-strength materials, rising demand for personal protection and increasing geopolitical tensions in emerging economies are the major factors driving the market growth. However, a stringent standard for ballistic composite products is restraining the market growth.

Ballistic protection provides protection against penetration of projectile with various velocities, shapes, and sizes. Generally, it is used by general security personnel, law enforcement personnel, and soldiers. A material that is used for making ballistic protection is selected on its ability to absorb energy as well as speed and efficiency of transferring that energy.

Based on application, the homeland security segment is estimated to have lucrative growth. Ballistic-resistant body armor is worn by homeland security officers while in the field to protect against specific ballistic threats. To ensure safety during any mission, homeland security officers use personal protective equipment; involve body vests, ballistic helmets, and gloves.. Homeland security officers combat systems used by are ballistic resistant as ceramics and thermoplastics reinforce them.

By geography, Asia Pacific is going to have high growth during forecast period, owing to the economic growth of countries in this region and increased defense spending in countries such as India, China, Japan, South Korea, and Australia. The governments of these countries and local industries are also joining-up with the contractors and supporting them through the procurement process by providing necessary financial and infrastructure aids. The increase in the number of insurgent groups entering the territories and using deadly explosives such as IEDs and bombs has further uplift

requirement for ballistic protection systems.
