Blood stream infection is a condition in which bacterial, fungal, or any infection is detected in the blood. It normally arises when infection in any part of body enters the blood stream and this infection is also considered as blood poisoning, bacteremia, septicemia, or sepsis. Self-diagnosis of blood stream infections is difficult due to its regular symptoms such as chills, fever, diarrhea, vomiting. As a result, testing is mandatory for detection of infection in blood.

Amongst End User, Hospital Laboratories segment accounted held significant market share during the forecast period. The healthcare industry is steadily adopting automated solutions to diminish the cost incurred on staffing and to produce accurate results. Also, automated solutions aid healthcare professionals in reducing the time taken for manually intensive tasks. This allows researchers to focus extensively on patient consultation and precision in diagnosis and improving productivity. By geography, North America dominated the market during the forecast period due to the factors such as high infection rate, increase in awareness, high diagnosis rate, favorable medical reimbursement scenario, and developed medical facilities in this region.
