According to Statistics MRC, the Global Cancer Diagnostics market is expected to grow from \$8.54 billion in 2016 to reach \$22.41 billion by 2023 with a CAGR of 14.8 %. Increasing incidence of cancer diseases, growing awareness about health care, and recent technological advancements in diagnostic devices are some of the factors propelling the market growth. In addition, favorable government reimbursement policies, increasing investments in research and development activities are some other factors boosting the market growth during the forecast period. On the other hand, high costs of diagnostic devices, strict regulations for new product approvals are the factors limiting the market growth.

Globally, cancer is the most emerging disease in recent times. Cervical, breast, liver, blood, kidney, colorectal, pancreatic, ovarian, melanoma, and lung cancers are types of cancers persisting in humans. Diagnosing at early stage can cure the disease and limit the disease severity. Research institutes have the high adoption rate of cancer diagnostic devices due to heavy funding from government and private institutions.

North America is estimated to be the dominant one among all, due to developed healthcare infrastructure, government initiatives towards public health care that are expected to drive this dominance. Asia Pacific region is predicted to grow at higher CAGR during the forecast period. The growth is attributed to rise in medical tourism market, increase in prevalence of cancer disease in countries such as Japan, China, and India are favoring the Asia Pacific market growth.
