## Abstracts

According to Statistics MRC, the Global Digital Pump Controller market accounted for \$ 8.19 billion in 2017 and is expected to reach \$ 15.85 billion by 2026 growing at a CAGR of 7.6% during the forecast period. Some of the key factors such as the increasing usage of connected devices like smartphones, laptops etc. and the installation of water pumps across all over the globe are driving the market growth. However, lack of awareness, technical challenges and inknowledge of operating electronic equipment such as pump controllers via mobile, app, or other systems by the people in rural areas who are mostly uneducated are the restraining factors for the market growth. Moreover, the increasing government support for wastewater treatment will provide ample opportunities for the growth of the market.

A digital pump controller replaces the tradition techniques to overcome need for manual operation of pumps that are used to pump water from a water tank or any other water source. An electric sensor is used in the digital pump controller, which is able to offer more accurate data than traditional pump controllers which are incapable of providing accurate data. A visible control panel is fixed on the top of a digital pump controller, and properly manages overall performance of the device. They can also be operated using a mobile or remote.

By Industry, agriculture application segment is likely to grow with highest CAGR during the forecast period due to increase in adoption of water pumps by farmers. By geography, Asia-Pacific is expected to observe significant growth in the forecast period, due to the demand of these controllers in the fields like agriculture, water and wastewater treatment.
