Abstracts

According to Stratistics MRC, the Global Electronic Health Record (EHR) Market is accounted for $26.80 billion in 2020 and is expected to reach $41.76 billion by 2028 growing at a CAGR of 5.7% during the forecast period. Rising demand for centralization and streamlining of healthcare administration, technological advancements in healthcare services and government initiatives to encourage healthcare IT usage are driving the market growth. However, high initial cost and data security concerns are hampering the growth of the market.

An electronic health records (EHR) is a digitalized version of storing patient's health records, plainly is a computerized version of paper records and is basically designed to store accurate data on patient health status across time. EHR provides integrating patient information from different sources which enable to make a better clinical decision.

Based on the installation, the client server based segment is going to have lucrative growth during the forecast period as it provides a safer alternative for users and offers an in-house data storage to prevent data theft. Moreover, they do not require a stable internet connection unlike the web-based systems, which further drives the segment growth. By geography, North America is going to have high growth during the forecast period due to the policies in the region that support HER adoption and the availability of well-established infrastructure with high digital literacy.
