## Abstracts

According to Statistics MRC, the Global Food Phosphate Market is accounted for \$2.50 billion in 2020 and is expected to reach \$4.63 billion by 2028 growing at a CAGR of 8.0% during the forecast period. The extensive utilization of food phosphate ingredient across the food & beverage industry and rise in demand for various bakery products such as pizzas, cakes, pastries, biscuits, rolls and doughnuts, are the major factors driving the market growth. However, the rising health concerns amongst the population with kidney disease and osteoporosis, and the increasing incidence of allergic reactions after consuming products with food phosphate additives are restraining the market growth.

Food phosphates is derived from phosphate rock and to strata of food addition that can help preserving natural flavours & colours, stabilization of texture in food, acidity and leavening. These additions are mainly used for increasing the shelf life of the food products and simultaneously, iron, magnesium and supporting calcium minerals enrichments. It has been added to food since 100 years. As phosphate are essential for life and present across multiple biological functions, however they are naturally present is almost all types of foods.

Based on application, the beverages segment is estimated to have a lucrative growth during the forecast period as beverages like tea or fruit drinks also can be fortified with phosphates which create lucrative growth opportunities in the market. Phosphates can be added to juice for calcium but doesn't affect the taste of juice like soy based%li%beverage. Phosphate additives helps in dispersion of soy proteins in drinks and adds calcium minerals, while other phosphate salts provide potassium in juices and offer the colour stability which should support the industry demand.

By geography, North America is going to have high growth during forecast period due to surge in demand for bakery & confectionery products. Increasing consumer focus on

High protein diets along with greater affordability has driven market statistics. Monocalcium phosphate is commonly used in baked goods as it has high naturalizing value and is very fast acting. Additionally, improving texture and baking aspects of the bakery products such as cake, and cookies manufacturers are opting for phosphate, in order to add nutrition value with no side effects. This has turned into massive demand for the market in the region.
