## Abstracts

According to Statistics MRC, the Global Lyme Disease Diagnostic Devices Market is accounted for \$840.29 million in 2020 and is expected to reach \$1,613.86 million by 2028 growing at a CAGR of 8.5% during the forecast period. Upsurge in incidence of Lyme disease, growing policy attention on improving health care services, and the advent of new diagnostic tests for Lyme disease are driving the market growth. However, lack of knowledge of the disease and ineffectiveness in Lyme disease research are hampering the growth of the market.

Lyme disease is a vector-borne illness which is spread by infected ticks. It is not easy to diagnose for many reasons, such as inflammation, dizziness, fatigue, joint or body pains, headaches that are quite common with other diseases, including circular red rash termed as erythema migrans (EM), which doesn't appear commonly. Hence, it is important to have the advanced diagnostic tool to discover potential targets of Lyme disease instantaneously. There is a substantial need to design rapid, point-of-care tests to determine whether patients are infected with 'Borrelia burgdorferi', the bacterium that causes Lyme disease, as early active assessment is imperative to detect to make prompt treatment.

Based on the end user, the hospitals segment is going to have lucrative growth during the forecast period. Hospitals are well-equipped to handle patient flow and employ latest diagnostic and treatment techniques. These factors are primarily responsible for the greater market share of hospitals. By geography, North America is going to have high growth during the forecast period owing to high incidence of Lyme disease and existence of state-of-the-art healthcare infrastructure.
