According to Stratistics MRC, the Global Medical Tubing Market is accounted for \$3.38 billion in 2017 and is expected to reach \$13.38 billion by 2026 growing at a CAGR of 16.5% during the forecast period. The rapidly growing healthcare industry, growing aged population and increasing concern about health problems, especially in developing nations are the key driving factors for the market. Furthermore, government initiatives to provide high-quality healthcare facilities, rising demand for medical devices that has medical tubing as a part of the equipment and growth of minimally invasive surgeries are some of the factors boosting the market growth. However, huge R&D expenditure associated with the product developments and strict government regulations are expected to hamper the market growth.

Medical tubing is used for fluid management and drainage as well as with anaesthesiology and respiratory equipment, IVs, catheters, peristaltic pumps, and biopharmaceutical laboratory equipment. Medical tubing meets medical industry requirements and standards for a variety of medical applications. It is produced by using some specific materials with the desired specification.

Silicone material segment is expected to lead the medical tubing market during the forecast period due to its resistance to temperatures (low & high). Silicone based medical tubing products can be manufactured in different forms, including solid, liquid, oil, rubber, grease, and semi-viscous paste forms because of its molecular structure. Silicone is highly flexible and high resistant to heat, cold, chemicals, UV radiation and moisture making it ideal for use in the medical & healthcare industries.

North America dominated the global medical tubing market with largest revenue share and is also expected to continue its dominance throughout the forecast period owing to its advanced and sophisticated healthcare infrastructure along with high per capita healthcare spending in the US. Asia pacific has huge growth potential in medical tubing

market due to improved living standards, growing aging population, increasing demand for minimally invasive surgeries and increased government initiatives.
