According to Statistics MRC, the Global Micro Server Market is accounted for \$42.95 billion in 2020 and is expected to reach \$101.14billion by 2028 growing at a CAGR of 11.3% during the forecast period. Rising demand to improve the operational efficiency, growing demand for cloud services and adoption of machine-to-machine learning theories are driving the market growth. However, lack of clarity about the workloads and lack of standard specification are hampering the growth of the market.

A micro-server is a small form-factor system on a chip (SoC) server which is stripped down as much as possible, in chip the storage space and the processor of the server are fit into a compact space. Microservers are most commonly used in datacenters and cloud computing technologies and are suitable for tasks that do not require several CPUs.

Based on the end user, the small and medium scale enterprise segment is going to have lucrative growth during the forecast period as small sized enterprises are increasingly making use of big data analytics to gain better business insights and are opting to hybrid cloud services to make significant cost savings operations. By geography, Asia Pacific is going to have high growth during the forecast period due to increasing amount of data traffic as a result of increased number of smartphones and tablets across the countries such as India & China which in turn increases the demand for microservers.
