Abstracts

According to Statistics MRC, the Global Minimally Invasive Surgical Instruments market is expected to grow from \$10.50 billion in 2016 to reach \$23.87 billion by 2023 with a CAGR of 12.4%. Better performance of minimally invasive surgeries as compared to traditional open surgeries is the main driving factor fuelling the market growth. Moreover, rising chronic disorders as well surgeries and innovative technological improvements are the factors boosting the market growth. On the other hand, lack of skilled surgeons to adopt new technologies and unstable regulations in the medical industries are restricting the market growth.

Based on application, the orthopedic surgery segment leads the market globally with the biggest market share and is expected to grow with a high CAGR during the forecast period. The growth of this segment is attributed to increasing geriatric population coupled with bone disorders and rising spine injuries. Among all product types, the handheld instruments segment dominates the global market. This is due to vast usage of the handheld instrument in most of all minimally invasive surgeries.

North America is leading the global market with a highest CAGR due to increasing government spending, growing numerous surgeries, increasing adoption of latest surgical instruments are some factors contributing to the North America market growth. Asia Pacific is projected to grow at a faster pace during the forecast period owing to rising geriatric population, presence of a large patient pool undergoing surgical treatments, growing awareness about modern surgical instruments and techniques, and implementation of various initiatives to reduce the rising healthcare is leading to an increase in the demand for minimally invasive surgical instruments, which is compelling key players to expand their geographical presence in this region.
