Abstracts

According to Statistics MRC, the Global Modified Atmosphere Packaging Market is expected to grow at a CAGR of 6.3% during the forecast period. Increasing demand for fresh and quality packaged food, increasing demand from emerging economies, consumer gaining confidence on food safety and rising demand for longer shelf life are the key driving factors for the market growth. However, factors such as high cost of development and stringent environmental legislations are some hindering the market growth.

Modified atmosphere packaging is a technology that extends the storage time of packaged food. The technology helps maintain freshness, nutrition value, color, and appearance of packaged food for a longer period. Modified atmosphere packaging alters the gaseous composition of the air present in a food package. The modified atmosphere allows fresh and minimally processed packed food products to maintain the visual, textural, and nutritional appeal.

Based on Application, the Bakery & Confectionery segment accounted for considerable market share during the forecast period. Bakery products contain a large number of bread-based products. To increase the shelf life, bread-based products required a high proportion of carbon dioxide in packaging solutions. Hence, this will increase the adoption of this technology during the estimated period. Geographically, Asia Pacific market is expected to grow at the highest CAGR during the forecast period. Growing urban population and high disposable income further increase the demand for packaged food and beverages. These are some of the factors pouring the demand of the market in the Asia Pacific region.
