## Abstracts

According to Statistics MRC, the Global Reach Stacker Market is accounted for \$376.55 million in 2020 and is expected to reach \$595.65 million by 2028 growing at a CAGR of 5.9% during the forecast period. Increasing trade activities between economies and government spending and increasing the capacity of existing ports to increase the volume handling capacity of the ports are driving the market growth. However, aggressive monetary policies may hamper the growth of the market.

A reach stacker is a vehicle used for handling intermodal cargo containers in small terminals or medium-sized ports. Reach stackers are able to transport a container very quickly and pile them in various rows depending on their access.

Based on the propulsion type, the internal combustion engine vehicle segment is going to have lucrative growth during the forecast period due to the rise in the demand for heavy load lifting machines. Stringent rules and regulations for engine-powered reach stackers are expected to propel the demand for the electric reach stacker market.

By geography, Asia Pacific is going to have high growth during the forecast period due to the increasing demand from various industries such as steel, construction, agriculture, chemicals, and electrical utilities and demand for container handling equipment. APAC has large ports for container handling
