According to our new research study on “Mid-Size Pharmaceutical Market Forecast to 2034 Global Analysis – by technology, application, animal type and Geography,” the market is anticipated to grow from US\$ 712.27 million in 2025 to US\$ 1,267.28 million by 2034, with a CAGR of 6.6% during 2025–2034. Specialty and orphan pharmaceuticals are emerging as a high-growth category as the increasing focus on personalized treatment approaches, rare disease management, and targeted therapies is driving demand for differentiated medicines tailored to specific patient populations and therapeutic needs.

One of the major factors behind the Mid-Size Pharmaceutical Market is the increasing need for specialty and orphan drugs. Mid-size pharmaceutical companies have started

emphasizing areas which involve extensive knowledge in science and business, and require their interaction with healthcare professionals and patients. Unlike other large pharmaceutical companies who prefer making blockbuster drugs, mid-size pharmaceutical companies are very suitable to make treatments for the small number of people because of limited competition and high unmet medical needs.

Due to the increasing incidence of cancers, auto-immune diseases, neurological illnesses, and genetically-linked diseases, there is an ongoing need for novel treatment mechanisms that provide better medical results. In addition, due to improvements in genomics, biomarkers testing, and precision medicine, better patient stratification is becoming possible, and therefore more focused treatment strategies can be created by pharmaceutical firms. Orphan drug status and other regulatory incentives in a number of key countries are stimulating investment in the area.

Thus, the trend has seen several mid-sized pharmaceutical firms grow through their specialty pipelines through research, licensing deals, strategic partnerships, and acquisitions. Besides growing their pipeline, the move has allowed for more value to be created in terms of high-revenue generation, greater competitiveness, and growth potential, making specialty and orphan diseases medicines the major driver of expansion for mid-sized pharmaceuticals.

The technological approach results from the natural incompatibility that exists between existing cellular networks and geographical landscapes of animal farming. The large-scale grazing landscapes, especially those used for raising cattle and sheep, have low population density, varying land surfaces, and poor telecommunications infrastructure. Such a situation makes it economically unviable and unstable to use existing connectivity technologies. The LPWAN technology helps address the limitations through decentralization of network structures, allowing sensor nodes to send data long-distance with minimum energy expenditure.

The Mid-Size Pharmaceutical Market participants are moving more towards the implementation of an approach that includes not only research and development activities but also specialization in certain products, licensing deals, acquisitions, and regionalization. More attention is paid by the firms to the creation of differentiated portfolio consisting of prescription and OTC drugs, orphan and non-orphan drugs, as well as oral, injectable, and topical drugs. Substantial financial resources are allocated for the development in such therapeutic areas as oncology, cardiovascular disease, diabetes, neurology, immunology, ophthalmology, infectious diseases, pain management, and autoimmune disorders. Moreover, partnerships with biotech firms,

educational institutions, health care organizations, as well as CDMO companies allow firms to increase the speed of development process, manufacturing capabilities, and access to the global market.
