Abstracts

The South America advanced medical stopcock market is expected to grow from US\$ 67.16 million in 2022 to US\$ 82.94 million by 2028; it is estimated to record a CAGR of 3.6% from 2022 to 2028 .

IV Therapy

Intravenous (IV) therapy is commonly administered to receive medications or fluids. One major benefit of IV infusion therapy is the fast delivery of medication/nutrients into the patient's body. Most IV infusion therapy can be completed within an hour, allowing the nutrients/medications to be transferred directly into the patient's blood. Several medical conditions do not allow sufficient absorption of nutrition, vitamins, and minerals. IV infusion therapy also provides instant rehydration. IV fluids are highly recommended for patients suffering from a fluid volume deficit.

Moreover, drug treatments or physical therapy usually cannot be modified as they are specifically designed to treat certain conditions. However, healthcare professionals can modify the treatment with IV infusions depending on the patient's medical needs. Furthermore, if the patient suffers from fatigue, allergies, or other medical impairment, the customizable nature of IV therapy can help improve issues experienced by the human body.

Further, hundreds of IV drip spas are opening across the South America that offers IV therapies that boost immunity, ease allergies, cure jet lag, restore youth and energy, and enhance athletic performance. Also, many celebrities endorse receiving boosts of

hydration and nutrients directly into the bloodstream. Additionally, beauty salons and gyms are following the trend by adding IV infusions to their services. Moreover, mobile IV services are also being offered, where the company provides in-home IV infusions administered by certified nurses.

Thus, owing to the advantages offered by IV therapy and the growing popularity of IV therapy, the South America advanced medical stopcock market is expected to grow over the forecast period.
