Abstracts

According to our new research study on “South Korea Dermatology Procedures Market Forecast to 2034 –Global Analysis – by Type, Intended Parents, Journey Type, Technology, and Geography,” the market is anticipated to grow from US\$ 4.25 billion in 2025 and is projected to reach US\$ 15.92 billion by 2034; it is expected to register a CAGR of 15.8% during 2026–2034. The South Korea dermatology procedures market growth is attributed to expansion of dermatology and medical aesthetics clinics as well as growth in number of patients with skin disorder in South Korea.

The South Korea dermatology procedures market includes a wide variety of procedures that are done to diagnose, treat, and cure skin problems as well as other dermatological

issues. The procedures done in the dermatology market include those done through various types of technology like laser technology, cryotherapy technology, electrosurgery devices, light therapy machines, microdermabrasion technology, and body contouring machines. These procedures can be done for various skin conditions like acne, pigmentary problems, psoriasis, hair removal, tattoo removal, wrinkle reduction, resurfacing, vascular lesions, and fat reduction.

An increase in skin disorders is playing a significant role in driving demand for dermatological procedures at hospitals, specialty dermatological clinics, and aesthetic procedure centers. Skin problems like acne, psoriasis, atopic dermatitis, rosacea, pigment abnormalities, melasma, and vascular lesions are becoming common targets for dermatological procedures rather than resorting to topical therapy alone or pharmacological treatment. Particularly, acne and post-acne scarring remain one of the major segments of the market due to their high prevalence rate among the adolescent and younger population group, while the issue of skin pigmentation remains the most frequent in people looking to improve their appearance. Awareness regarding skin health and easy accessibility to dermatologists have been contributing to early detection of various skin conditions as well as increased popularity of procedural options that offer quicker results compared to traditional treatment techniques. As a consequence, an increasing number of patients are choosing to go for laser procedures, photodynamic therapies, cryoablation techniques, and other dermatological skin resurfacing procedures.

Also, another important aspect influencing the dynamics of the market is people's desire to undergo minimally invasive treatments. The market features a variety of procedures aimed at improving patients' skin appearance, treating skin conditions, or reducing visible signs of aging without resorting to surgery. In general, patients in South Korea tend to prefer those procedures which provide good results without causing a lot of pain and allowing them to get back to their usual routine after being treated. As a result, minimally invasive procedures, such as laser skin rejuvenation, pigment removal, radiofrequency skin tightening, light-based procedures, as well as other non-invasive body shaping treatments, have gained popularity. Minimally invasive procedures appeal to different patient segments from young people interested in preventive procedures to older patients who want to look better. Innovations in dermatologic equipment also promote the popularity of these procedures among patients.

For the South Korea dermatology procedures market, key insights and analysis are derived major healthcare companies, dermatology associations, regulatory bodies, and clinical research organizations. Such sources include but are not limited to the World

Health Organization, International Society of Dermatology, American Academy of Dermatology, and Korean Dermatological Association. Additionally, the market analysis will benefit from information gathered from regulatory bodies and health care authorities that are involved in regulation and standardization of medical devices in South Korea. Other valuable sources include dermatological peer-reviewed journals, aesthetic medicine literature, data and records from hospitals and clinics, annual reports of firms operating in South Korea, investors' presentations, and announcements of medical devices companies. Also, an essential component of the analysis will be clinical trials analyzing the safety and efficacy of laser, cryotherapy, electrosurgical, light therapy, microdermabrasion, and body contouring devices.
