Methacrylic anhydride (also called methacryloyl anhydride, dimethacrylic anhydride; methacrylic acid anhydride) is an organic compound with the molecular formula $C_8H_{10}O_3$. When combined with water, it creates an exothermic reaction to form methacrylic acid. The reactions are sometimes slow, but can become violent when local heating accelerates their rate. This colorless, viscous liquid has the melting and boiling points of -20°C and 87°C 13 mm Hg(lit.) respectively.

On an industrial scale, methacrylic acid is widely produced as a precursor to its esters, particularly methyl methacrylate (MMA) and poly(methyl methacrylate) (PMMA).

The methacrylates have numerous uses, most notably in the production of polymers with such trade names as Lucite and Plexiglas.

Methacrylic anhydride is a reactive monomer which is used primarily in the preparation of other monomers under mild reaction conditions. Homopolymers are linear and contain cyclic anhydride units, uncrosslinked.

Methacrylic anhydride is used as light-curing coatings, crosslinked copolymers suitable for use as adsorbents and ion-exchange resin precursors.

Methacrylic anhydride market is covered in the study Methacrylic anhydride (CAS
