BRIEF SUMMARY

The car rental aggregator industry took off in 2010 when a large number of startup companies ventured into this business with a goal to alleviate the outstation and within the city commuting problem of people and corporates. It is a sunrise industry that has grabbed the attention of venture capital and PE firms with many startups attracting Angel and Series A funding. The car rental industry is a highly unorganized and fragmented market in India. It is a ubiquitous problem in India for the people to get a good quality car at affordable rates for their outstation or full day city travel plans and for the car operators to ensure that the cars are well utilized to get good returns on their investment on the vehicle. Currently the car utilization rate in the industry is around xx%-xx%. It is this twin problem that this industry is trying to solve.

Since the aggregators follow an asset light model, as they do not own the car, the entry barriers in this market are low. Hence, this industry is expected to witness many new entrants and face intense competition in the future. However, the companies which are early entrants in the industry and successful in establishing their brand value would have an edge over the companies that enter later and are more likely to be successful in this industry. Quality of service and scale of operations are imperative for the success of the companies.
